Systems

- 115° wide angle field of view
- Quick lock connector for secure connection and fast telescope exchange
- Distortion-free image
- Automatic click-connector
- Scratch-proof sapphire glass front window
- Long-term autoclavability

Olympus TrueView II telescopes are based on a completely new and revolutionary lens system. The unique wide field of view allows a tremendous image size without distortion. The 115° field of view supports easy navigation in the joint with less rotation of the telescope. Beyond that a new quick lock mechanism for tight and secure camera connection is introduced. It is the combination of outstanding optical performance and durable mechanical design that makes Olympus telescopes something special.
